

What we can add to the dashboard, and what we can't

Checked on 24 Aug 2026 against the live Instagram API, using the real tokens in `config.json` (account: multiadesign). Everything below is tested, not guessed.

Short version: **out of the 6 things you asked for, 4 are fully doable, 1 is half doable, and 1 is not possible at all.** Most of them cost us nothing extra, because the dashboard is already downloading the data and just not showing it.

1. Business impact — link clicks and bio link taps

Yes, we can do this.

Instagram will tell us how many people tapped the website link in your bio, and how many tapped the contact buttons (call, email, message, address). We tested it: your account got 24 website taps in the last 30 days.

What we get:

- Website link taps
- Bio button taps, split by which button they tapped
- All of it for the last 7 / 14 / 30 / 90 days and all-time

What we don't get:

- A day-by-day line chart of clicks. Instagram only gives us the total for a

period, not the daily breakdown. So it'll be a number with a comparison ("24 taps, up 30% from last month"), not a graph.

One note: the contact-button number is showing 0 right now. That's not a bug — it means your profile doesn't have call/email buttons set up. Adding them in the Instagram app will start the counter.

2. Comparisons — week by week growth and benchmarks

Half of this already exists. The rest is easy.

Already there: reach for the last 12 weeks.

We can add, with no extra load on the system:

- Net follower growth per week (gained minus lost) — we already download

this daily, we just don't add it up by week

- "Up 12% vs last week" style comparisons on any number
- Views, saves and interactions per week, same as reach

Benchmarks: this needs a reality check. Instagram does not give anyone industry averages. Nobody has that data through the API — the tools that claim to have it are estimating. What we *can* give you is honest and arguably more useful:

- Compare this week against your own last 4 weeks and your best week ever
- Compare your three accounts (multia, multiadesign, aranyaliving) side by side

So you'd get "this week is 20% above your normal" instead of "this week is above the industry average". The first one is real.

3. SEO and keyword analytics

No. This one isn't possible.

I want to be straight about this rather than build something that looks like it works. Instagram does not tell business accounts:

- What people searched to find you
- Where you rank for any keyword
- Which search terms brought traffic

That data simply isn't in the API for anyone. There's a hashtag search feature in Meta's system, but it needs a completely different login setup, and even then it shows you *other people's* top posts for a hashtag — not your own ranking. It wouldn't answer your question.

What we can build instead, which gets at the same goal:

Every caption is already in our data. So we can analyse your own posts and show:

- Which hashtags you use correlate with the highest reach
- Which words and CTA phrases show up in your best-performing posts
- Which hashtags bring in people who *don't* already follow you

That's "which of my words are working", not "how do I rank on Instagram search". Different question, but it's the one that actually changes what you write next.

4. Which format brings the most reach

Yes — and we're already downloading this data, we just never displayed it.

The dashboard has been pulling reach and views split by format every single day for 90 days. It's sitting in the data unused. Turning it into a chart is frontend work only.

Your last 30 days, by views:

Format	Views
Ads	80,076
Stories	10,401
Carousels	7,210
Reels	5,682
Single posts	708

We can also split each format by "people who already follow you" vs "new people". That's the number that actually tells you what to boost — a format that only reaches existing followers isn't growing you, no matter how good the views look.

5. Ads vs organic

Mostly yes, and it doesn't need a new Instagram setup — with one limit.

We can separate ads from organic across reach, views, likes, comments, shares and saves. Instagram labels ad traffic separately and we're already pulling it.

Something you should know right now: 77% of your views in the last 30 days came from ads. Your dashboard currently adds paid and organic together in the big numbers at the top. So the headline figures look much stronger than your organic performance actually is. Splitting these two apart is probably the single most honest change we can make to the dashboard.

What we cannot get: money. Ad spend, cost per click, cost per result, return on ad spend, and per-ad-creative results all live in Meta's advertising system, which is a separate login with separate permissions. Your current tokens are rejected by it — I tested.

So you'd get: "ads brought 54,208 new people, organic brought 2,565." You would not get: "and it cost ₹X per person."

If the spend side matters, that's a separate setup (connecting the dashboard to your Meta Ads account) and I can scope it as its own job.

6. When your followers are most active

Yes, and this is the biggest new thing on the list.

Instagram gives us how many of your followers are online, hour by hour, for the last 28 days. I tested it on all three of your accounts and the data is there and complete.

That means a proper grid: 7 days across, 24 hours down, showing exactly when your audience is awake and scrolling. Right now the dashboard has a "posting heatmap", but that's a different thing — it shows when *you* posted and how those posts did. It doesn't tell you when your followers are actually around.

One important catch: Instagram sends these hours in its own timezone, not Indian time. Left uncorrected, the dashboard would recommend posting at roughly the opposite time of day. We fix that with an offset before showing anything — just flagging it so nobody trusts the raw numbers on day one.

Summary

What you asked for	Verdict
Link clicks and bio taps	✓ Yes
Week-wise growth comparison	✓ Yes
Industry benchmarks	✗ No — use your own history instead
SEO / keyword ranking	✗ No — but caption analysis gets at the same goal
Which format brings reach	✓ Yes — data already downloaded
Ads vs organic performance	✓ Yes
Ad spend / cost / ROI	✗ No — needs a separate Meta Ads connection
Follower active times	✓ Yes

Two real dead ends: ad spend figures, and Instagram search/SEO data. Everything else on your list can be built.

What I'd build first

Ordered by how much it tells you versus how long it takes:

1. **Follower active times** — biggest genuinely new insight, one API call
2. **Ads vs organic split** — fixes misleading headline numbers, data already here
3. **Format performance chart** — already downloaded, needs a chart only
4. **Link and bio taps** — a few lines of code

5. **Week-by-week growth** — adding up numbers we already have

6. **Caption and hashtag analysis** — the SEO substitute

7. **Ad spend** — only if you want it, needs a separate Meta Ads setup

Items 2 through 6 add no extra load to the dashboard at all. They use data we're already paying to download.
